## CHAPTER 1

## THE SI NGAPORE ECONOMY

## OVERVIEW

In the third quarter of 2011,

- The economy grew by 6.1 per cent compared to the same period in 2010.
- The manufacturing and financial services sectors were the main contributors to overall growth.
- Employment grew by 32,300.
- The consumer price index increased by 5.5 per cent compared to a year ago.

## OVERALL PERFORMANCE

- The economy rose by 6.1 per cent in the third quarter of 2011, up from the 1.0 per cent growth in the preceding quarter. On a quarter-on-quarter seasonally-adjusted annualised basis, the economy saw a mild growth of 1.9 per cent, after contracting by 6.4 per cent in the second quarter of 2011.
- The manufacturing and financial services sectors expanded in the third quarter of 2011 compared to the same period a year ago, by 14 per cent and 11 per cent respectively. The hotels and restaurants, transport and storage, and other services sectors also registered healthy growth rates ranging from $4.0-5.6$ per cent during the quarter. By contrast, the wholesale and retail trade sector declined marginally by 0.2 per cent.
- The main driver of GDP growth in the third quarter of 2011 was the manufacturing sector, which accounted for 3.7 percentage-points of overall GDP growth. This was followed by the financial services sector, which contributed 1.2 percentage-points. The other services and transport and storage sectors both added 0.4 percentage-points each. Together, these four sectors accounted for more than 90 per cent of overall economic growth in the third quarter.

Exhibit 1.1: GDP and Sectoral Growth
Rates in 3Q 2011

Exhibit 1.2: Percentage-Point Contribution to Growth in Real GDP in 3Q 2011 (By Industry)

## SOURCES OF GROWTH

- Total demand increased by 2.7 per cent in the third quarter, compared to the 2.4 per cent growth in the second quarter.
- Growth was led by domestic demand, which rose by 14 per cent in the third quarter, compared to 4.1 per cent in the preceding quarter. By contrast, external demand fell slightly by 0.3 per cent following a 1.9 per cent increase in the previous quarter.
- Consumption expenditure rose by 6.0 per cent in the third quarter. Private consumption increased by 7.1 per cent due to higher spending in the recreation and culture segment. Government consumption grew by 2.3 per cent.
- Gross fixed capital formation grew by 6.3 per cent, as both public and private investment increased. Private investment rose by 5.0 per cent, supported by increases in the transport equipment, as well as machinery, equipment and software segments. Public investment expanded by 14 per cent, mainly due to an increase in the non-residential buildings segment.
- Inventories also increased in the third quarter of 2011, contributing 1.5 percentage-points to total demand growth.

## LABOUR MARKET

## Employment

- Based on preliminary estimates, the third quarter of 2011 saw a strong employment growth of 32,300 . This was higher than the gains of 24,800 in the preceding quarter and 20,500 in the third quarter of 2010.
- The bulk of the employment gains in the third quarter of 2011 came from the services sector. Services employment rose by 21,900 , higher than its increase in the preceding quarter $(20,200)$. Construction added 6,600 workers, while manufacturing employment rose by 3,500 . These increases were also substantially higher than the employment gains in the respective sectors in the previous quarter.

${ }^{1}$ For inventories, this refers instead to change as a percentage of GDP in the previous year.

Exhibit 1.4: Percentage-Point Contribution to Total Demand Growth

Exhibit 1.5: Change in Total Employment

## Unemployment

- Unemployment fell slightly after rising in the previous quarter. The seasonallyadjusted overall unemployment rate declined from 2.1 per cent in June 2011 to 2.0 per cent in September 2011. The seasonally-adjusted unemployment rate for residents dipped from 3.0 per cent to 2.9 per cent over the same period, while that for citizens fell from 3.1 per cent to 3.0 per cent.
- An estimated 52,500 residents, including 45,700 citizens, were unemployed in September 2011. The seasonally-adjusted figures were 61,300 for residents and 53,200 for citizens.

## COMPETITI VENESS

## Productivity

- Labour productivity grew by 2.3 per cent in the third quarter of 2011 compared to the same period a year ago. This was a reversal from the 2.4 per cent decline in the previous quarter.
- The improvement was driven mainly by a rebound in productivity growth in manufacturing (14 per cent). By contrast, productivity in the construction sector declined by 2.1 per cent after improving slightly in the previous two quarters.
- Other than financial services (3.7 per cent) and other services ( 0.4 per cent), the rest of the services sectors registered productivity losses. The sharpest declines were seen in information \& communications (-6.8 per cent), wholesale \& retail trade (-4.4 per cent) and business services (-2.4 per cent).

Exhibit 1.6: Seasonally-Adjusted Overall, Resident and Citizen Unemployment Rates

Exhibit 1.7: Changes in Labour Productivity for the Overall Economy and Sectors in 3Q 2011

## Unit Labour Cost and Unit Business Cost

- Overall unit labour cost (ULC) for the economy rose by 3.8 per cent in the third quarter of 2011, moderating from the 11 per cent growth in the previous quarter. The smaller increase could be attributed to the improvement in labour productivity in the third quarter.
- Manufacturing ULC fell by 7.4 per cent, a reversal from the 14 per cent increase in the second quarter. This reflected the strong productivity gains in the manufacturing sector.
- Unit business costs (UBC) in the manufacturing sector fell marginally by 0.1 per cent in the third quarter, reversing from the 6.9 per cent increase in the previous quarter.
- Although the manufacturing ULC improved, services cost (such as utilities charges and rentals) increased by 3.6 per cent during the quarter.

Exhibit 1.8: Change in Unit Labour Cost

Exhibit 1.9: Percentage-Point Contribution to Change in Unit Business Costs for Manufacturing

Exhibit 1.10: Fixed Asset I nvestments by I ndustry Cluster in 3Q 2011

[^0]- In terms of TBS, the headquarters and professional services cluster attracted the largest amount of commitments, at \$570 million (or $\$ 532$ million if depreciation is excluded). This was followed by the electronics cluster, with $\$ 404$ million worth of commitments (or $\$ 275$ million if depreciation is excluded).
- The US was the biggest foreign contributor for both FAI and TBS, accounting for 66 per cent and 43 per cent of total FAI and total TBS respectively (or 41 per cent of TBS if depreciation is excluded).
- When fully realised, the FAI and TBS commitments are expected to generate value-added of $\$ 5.6$ billion and create more than 5,600 skilled jobs.

## PRICES

## Consumer Price I ndex

- The consumer price index (CPI) increased by 5.5 per cent in the third quarter of 2011, compared to the same period a year ago. This was higher than the 4.7 per cent growth in the previous quarter. On a quarter-on-quarter seasonallyadjusted basis, the CPI rose by 1.5 per cent, up from the 0.8 per cent increase in the preceding quarter.
- Housing costs, the main contributor to CPI inflation, rose by 9.7 per cent, due to higher accommodation costs and electricity tariffs.
- Transport costs increased by 12 per cent, driven by higher prices of cars and petrol.
- Food prices grew by 3.0 per cent, as a result of more expensive prepared meals, fresh fish, dairy products \& eggs, as well as meat \& poultry.
- The overall cost of the "recreation \& others" category increased by 1.7 per cent, due to higher holiday travel cost and salaries for foreign maids.
- Education \& stationery costs rose by 2.6 per cent, as a result of higher fees at commercial institutions, universities, childcare centres, kindergartens and playgroups.

Exhibit 1.11: Total Business Spending by I ndustry Cluster in 3Q 2011

## Exhibit 1.12: Changes in CPI

Exhibit 1.13: Percentage-Point Contribution to Change in Overall CPI in 3Q 2011

- Healthcare costs grew by 1.9 per cent, driven by costlier proprietary medicines, as well as higher fees for hospitalisation, medical specialist services and dental treatment.

## EXTERNAL BALANCE

## Trade

- Total trade in nominal terms grew by 5.4 per cent in the third quarter, compared to the 7.5 per cent increase in the second quarter. In volume terms, total trade declined marginally by 0.3 per cent, reversing the 1.9 per cent increase in the previous quarter.
- Total exports rose by 4.8 per cent after the 6.7 per cent increase in the previous quarter. Domestic exports expanded by 15 per cent. By contrast, re-exports declined by 5.7 per cent.
- Within domestic exports, oil domestic exports surged by 54 per cent, while nonoil domestic exports saw a small decline of 1.1 per cent. Electronics domestic exports contracted sharply by 17 per cent, which more than offset the 8.3 per cent increase in non-electronics exports.
- Within re-exports, oil re-exports grew by 2.0 per cent, while non-oil re-exports fell for the second consecutive quarter by 6.7 per cent.
- Total imports increased by 6.2 per cent. Within non-oil imports, imports of nonelectronics rose by 8.6 per cent, while electronics imports contracted by 18 per cent. Oil imports rose by 31 per cent.

## Balance of Payments

- The overall balance of payments surplus widened to $\$ 10.1$ billion in the third quarter of 2011, from $\$ 5.5$ billion in the second quarter.
- This primarily reflected a decline in net outflow in the capital and financial account, and a slight increase in the current account surplus.

## Current Account

- The surplus in the goods account rose from $\$ 14.8$ billion in the second quarter of 2011 to $\$ 15.3$ billion in the third quarter, as exports grew more than imports.
- The services surplus increased marginally to $\$ 4.5$ billion in the third quarter as compared to $\$ 4.4$ billion in the second quarter. This was largely due to a decline in net travel payments, which offset higher net royalty payments.
- The deficit in the income balance remained largely unchanged at \$2.9 billion.

## Capital and Financial Account

- In the financial account, the net outflow narrowed from $\$ 6.2$ billion in the second quarter to $\$ 2.1$ billion in the third quarter. This was largely because "other investment" turned from a deficit of \$0.1 billion to a surplus of $\$ 5.2$ billion, as banks reduced their overseas holdings of other assets.
- The net outflow of portfolio investment also fell slightly, from $\$ 10.6$ billion in the second quarter to $\$ 9.9$ billion in the third quarter.
- Net foreign direct investment inflows declined from $\$ 4.6$ billion in the second quarter to $\$ 2.6$ billion in the third quarter. This reflected a larger increase in residents' outward investment compared to the increase in gross foreign investment in Singapore.

Exhibit 1.15: Balance of Payments

CHAPTER 2

## PERFORMANCE OF SELECTED SECTORS

## OVERVI EW

- The manufacturing sector expanded in the third quarter of 2011, driven by strong growth in the biomedical manufacturing cluster.
- The wholesale and retail trade sector's value-added contracted marginally, weighed down by the decline in electronics exports and weaker trade outlook.
- The transport and storage sector's growth moderated due to slower air cargo growth.
- Growth of the financial services sector was supported by growth in the resilient financial intermediation cluster.

## MANUFACTURI NG

- The manufacturing sector expanded by 14 per cent in the third quarter of 2011, reversing the decline of 5.6 per cent in the previous quarter.
- The biomedical manufacturing cluster surged by 89 per cent, driven by a 93 per cent gain in the pharmaceuticals segment as firms produced a different value-mix of active pharmaceutical ingredients.
- The chemicals cluster expanded by 3.9 per cent, largely driven by the specialty chemicals segment which grew 23 per cent due to new production capacities.
- Growth in the precision engineering cluster moderated to 1.9 per cent after growing strongly in the first half of the year, as machinery orders eased and demand for precision modules and components slowed.
- The transport engineering cluster grew by 2.1 per cent, led by the aerospace segment which rose 7.2 per cent as demand for aircraft repair and maintenance services remained healthy.
- By contrast, the electronics cluster declined by 22 per cent with all segments recording lower output as global demand for electronics weakened. In particular, the semiconductors segment contracted by 24 per cent as export orders fell.
- The general manufacturing cluster contracted by 7.5 per cent, led by a 14 per cent decline in the miscellaneous industries segment. Meanwhile, the food, beverages \& tobacco segment grew by 1.0 per cent.

Exhibit 2.1: Manufacturing Growth Rates

Exhibit 2.2: Percentage-Point Contribution to Manufacturing Sector's Growth in 3Q 2011

## WHOLESALE AND RETAI L TRADE

- The wholesale and retail trade sector contracted by 0.2 per cent in the third quarter of 2011, in line with slowing global trade flows. Growth of non-oil domestic exports (NODX) moderated to 3.2 per cent in the third quarter from 5.8 per cent in the previous quarter. Non-oil re-exports (NORX) contracted by 3.9 per cent, down from the 0.4 per cent growth in the previous quarter.
- Retail sales volume grew by 2.0 per cent in the third quarter, a sharp moderation from the 7.6 per cent growth in the previous period. Excluding motor vehicle sales, retail sales volume grew by 4.4 per cent, down from the 7.2 per cent growth in the second quarter.
- With the exception of motor vehicles (-5.6 per cent), optical goods and books (-5.5 per cent) and supermarkets (-1.6 per cent) which contracted in the third quarter, most retail segments recorded positive growth. Segments that posted the strongest growth were telecommunication apparatus and computers ( 8.8 per cent) and wearing apparel and footwear (8.7 per cent).

## TRANSPORT AND STORAGE

- The transport and storage sector grew by 4.2 per cent in the third quarter of 2011, moderating slightly from the 4.4 per cent growth in the previous quarter due to weaker air cargo growth.
- The sea transport sector grew in tandem with the 6.9 per cent increase in container throughput in the third quarter, driven by regional trade flows.
- In the air transport sector, air passenger traffic registered gains of 13 per cent in the third quarter, lifted by robust visitor arrivals into Singapore.

Exhibit 2.3: Changes in Wholesale and Retail Trade VA, Real NODX and Real NORX

Exhibit 2.4: Changes in Retail Sales I ndex at Constant Prices

Exhibit 2.5: Changes in Container Throughput, Air Passenger and Air Cargo Handled

## FI NANCI AL SERVI CES

- The financial services sector grew by 11 per cent in the third quarter of 2011, following a 9.9 per cent expansion in the preceding quarter.
- The financial intermediation cluster remained resilient. In particular, domestic banking unit (DBU) non-bank lending rose by 31 per cent, led by an increase in loans to the general commerce sector (72 per cent), manufacturing sector ( 58 per cent) and financial institutions (42 per cent). Offshore loans also continued to grow, albeit at a more moderate pace of 11 per cent, as compared to the 14 per cent expansion in the previous quarter.
- By contrast, the sentiment-driven segments remained weak, weighed down by volatility in global financial markets. For instance, the Straits Times Index plunged 14 per cent in the third quarter of 2011. In addition, average daily domestic stock market turnover volumes contracted by 22 per cent, following the 25 per cent decline in the preceding quarter.

Exhibit 2.6: Growth of Bank Loans and Advances to Non-Bank Customers by I ndustry in 3Q 2011

## CHAPTER 3

## ECONOMI C OUTLOOK

## LEADI NG I NDI CATORS

- The composite leading index fell by 2.9 per cent on a quarter-on-quarter basis in the third quarter of 2011, after registering marginal declines in the preceding two quarters.
- Six of the nine components within the index - namely, US Manufacturing Purchasing Managers' Index, stock prices, new companies formed, stock of finished goods, domestic liquidity, and wholesale trade - decreased compared to the preceding quarter.

Exhibit 3.1: Composite Leading I ndex Levels and Growth Rate

- The remaining three indicators registered improvements from the preceding quarter, namely, non-oil sea cargo handled, non-oil retained imports and money supply.

## OUTLOOK FOR 2011

The Singapore economy grew by 6.1 per cent on a year-on-year basis in the third quarter of 2011, an improvement from the growth of 1.0 per cent in the previous quarter. Growth mainly reflected the strong performance in the biomedical manufacturing cluster, which helped offset declines in the electronics cluster and the wholesale and retail trade sector. With the externally-oriented sectors likely to remain weak in the final quarter of the year, the Ministry of Trade and Industry (MTI) expects the Singapore economy to grow by around 5.0 per cent for the whole of 2011.

In 2012, growth outlook for the global economy is expected to remain subdued. In the advanced economies, final demand is likely to be restrained by ongoing economic adjustments. In Asia, growth is expected to ease, notwithstanding some support from resilient domestic demand. Against this macroeconomic backdrop, Singapore's externally-oriented sectors such as electronics and wholesale trade will continue to perform poorly. Growth in the financial services sector is also expected to be lacklustre due to heightened economic uncertainties and financial volatilities. Nevertheless, there will be modest support to growth from some sectors. In particular, the biomedical manufacturing cluster is expected to see a higher level of output in 2012, due to increased production of active pharmaceutical ingredients and biologics. Growth in the tourism-related sectors will also be sustained by increasing visitor arrivals especially from the region.

Taking into account the above factors, MTI expects the Singapore economy to grow by between $\mathbf{1 . 0}$ to 3.0 per cent in 2012. However, there are significant downside risks to growth, in view of the worsening sovereign debt situations in the advanced economies. Should these economies experience a sharp recession or a full-blown financial crisis, Singapore's growth in 2012 could come in weaker than expected.

## FEATURE ARTICLE

THE LONG-TERM I MPACT ON WAGES OF ENTERI NG THE LABOUR MARKET IN A RECESSI ON IN SI NGAPORE

## THE LONG-TERM I MPACT ON WAGES OF ENTERI NG THE LABOUR MARKET IN A RECESSI ON IN SI NGAPORE

## EXECUTIVE SUMMARY

- This study examines whether university graduates who entered Singapore's labour market during recessions suffer from depressed wages over the long term compared to their peers who entered during better times.
- Findings show that graduates who entered during recessions would receive lower wages on average. However, their wages would fully catch up with their 'luckier' peers after three years of job experience.
- This suggests that Singapore's labour market is sufficiently efficient, and that the overall social loss is small.

The views expressed in this paper are solely those of the authors and do not necessarily reflect those of the Ministry of Trade and Industry, the Singapore Department of Statistics or the Government of Singapore.

## I NTRODUCTION

Singapore has experienced increasing economic volatility in recent years. In the past 15 years, Singapore went through three recessions compared to only one before 1996. Although Singapore rebounded strongly and quickly from each of these recessions, the recessions could leave a long-term impact on certain segments of the labour force. One such segment is fresh entrants to the labour market.

The immediate disadvantages of entering the labour market in poor economic conditions are apparent. Youths who complete their education or vocational training during recessions are likely to experience longer job search times, suffer from job mismatches, and receive lower starting wages compared to those who start when economic conditions are better.

What is unclear is whether these 'unlucky' youths will continue to receive lower wages in the long run compared to their luckier counterparts. If the disadvantages of entering the labour market in poor economic conditions persist in the long run, the Government may need to look into policies that support youth employment during recessions to minimise the extent of (downward) wage persistence. Conversely, if the wages of 'unlucky' youths rebound quickly after the recession, one can infer that the labour market is sufficiently efficient in minimising wage persistence. There will then be less need for policy interventions by the Government.

To the best of our knowledge, there has not been any empirical research that examines whether youths in Singapore face downward wage persistence if they enter the labour force during a recession. Yet, this is an area of research that is of growing importance. With rising economic volatility in Singapore, more cohorts may have to enter the labour market during periods when the economy is not doing well. This paper therefore seeks to answer the key question - does entering the labour market in a recession have a long-term negative effect on wages?

## LITERATURE REVI EW

## Why entering in a recession may leave a lasting negative impact...

Workers who enter the labour market during economic downturns may have persistently lower wages hence lower lifetime wages - compared to those who enter during favourable economic conditions. Besides long-term contracts which bind 'unlucky' workers to jobs that pay less (Beaudry and DiNardo, 1991), wage differences between lucky and unlucky cohorts can also arise from disparities in human capital accumulation.

With limited job options in a recession, individuals are more likely to face job mismatches or be underemployed. ${ }^{1}$ According to Gibbons and Waldman (2004), these workers could then end up with low skill acquisition or acquire skills with low transferability. Given lower levels of human capital, their future wages may then be constrained. Gardecki and Neumark (1998) provide support for this theory with evidence that on-the-job training in the early stages of a person's career has a lasting impact on wages. Oreopoulos, von Wachter and Heisz (2006) further find that lasting reductions in the quality of employees can explain up to 40-50 per cent of persistent earnings losses.

As to why 'unlucky' workers may not switch jobs when economic conditions improve, Gibbons and Waldman (2006) argue that workers acquire "task-specific human capital" in their first jobs which then give them a comparative advantage with their initial employers. Neal (1995) also shows that a portion of the returns to tenure with a prior employer, which is often used as a proxy for specific skills, is rewarded when workers are reemployed in the same industrial sector. Therefore, even if the job market is frictionless, 'unlucky' workers may choose to stay with their first employers because they may obtain higher utility from doing so.
'Unlucky' cohorts could also suffer from depressed wages because the job market takes the initial job placement as a signal of their ability, and fails to take into account the condition of the market when they first joined. In particular, when determining the wages of a new employee, employers typically look at the last drawn wage. Therefore, for a graduate who received a lower wage in his first job because he had entered during a recession, his new employer may take the lower entry wage as a signal of weaker ability, rather than attribute it to the effect of initial labour market conditions. He thus continues to pay the graduate a lower wage, causing the graduate to be disadvantaged over the long term. Einav and Yariv (2006) find evidence of such cognitive biases in the economics job market. They show that economists fail to adequately compensate for the advantages conferred by alphabetical ordering to those with a last name early in the alphabet when they evaluate one another.

## Why entering in a recession may not leave a lasting negative impact...

However, entering the labour market in an economic downturn may not leave a lasting negative impact on wages if job mobility is high. Bachmann, Bauer and David (2010) find that workers with initial cohort wages below the average are more likely to leave their jobs. By changing employers, workers can close the initial wage differentials between entry cohorts. In fact, using a job search model, Topel and Ward (1992) show that wage gains from job changes account for a third of early-career wage growth. 'Unlucky' cohorts can therefore potentially overcome their initial disadvantaged position if they are able to move into better or preferred jobs with higher pay once the economy recovers.

In particular, job mobility in early careers is important to help overcome the negative impact that initial labour market conditions have on wages. As Oreopoulos et al. (2006) show, search frictions intensify with age and cause initial unemployment rates to lead to permanent earnings differences. Hence, factors that affect job mobility in early careers can determine the extent to which entry labour market conditions exert a persistent negative impact on wages.

[^1]One such factor is the enforceability of job contracts. According to models of implicit contract, wage contracts could be sticky downwards, implying that economic conditions at entry could be less important than the economic conditions faced by the individual during his career in determining his wages over the long term. In the United States, Schmieder and von Wachter (2010) find that wages increase as outside options improve if employers are contractually prevented from lowering wages or laying off workers, while workers are able to leave if they get better job offers outside. As such, wages could be less affected by the economic conditions at entry than they are by the minimum rate of unemployment faced by the worker while he is on the job.

## DATA DESCRI PTI ON

In this study, we focus on university graduates who are either Singapore Citizens or Permanent Residents (PRs). ${ }^{2}$ We treat a university graduate as a fresh entrant to the labour market in a particular year if:
a) He or she is aged $28^{3}$ or below in that year; and
b) That year marks the first year in which wage data for him/her is recorded.

Using a longitudinal dataset of these graduates that spans the period 2000 to 2008, we are able to track the wages of eight cohorts of graduates who entered the labour market between 2000 and 2007. ${ }^{4}$

Annual resident unemployment rate is used as an indicator of the health of the economy. ${ }^{5}$ This is similar to the strategy used in most of the related literature. ${ }^{6}$ Exhibit 1 shows the annual resident unemployment rate in Singapore over the period of study. It can be seen that Singapore has enjoyed relatively low resident unemployment in recent years, with the resident unemployment rate hovering within a 2.2 percentage-point band.

Plotting the annual resident unemployment rate against the real mean starting monthly wage of graduates entering the labour market, we can see that the two tend to be inversely related (Exhibit 2). When the annual resident unemployment rate is higher, the real mean starting monthly wage of the entry cohort tends to be lower. Details are in Exhibit 5 of the appendix. Beyond the immediate impact of the recession on entry wages, it is important to find out whether the negative impact continues over the longer term.

[^2]Exhibit 1: Singapore's Annual Resident Unemployment Rate, 2000-2008

Exhibit 2: Real Mean Starting Monthly Salary of
Entry Cohorts and Annual Resident Unemployment Rate, 20037-2008

## EMPI RI CAL STRATEGY

Our empirical strategy is adapted from Kahn (2010). ${ }^{8}$ We use a standard Mincer earnings function, with the resident unemployment rate included as an indicator of the overall health of the economy.

Equation (1):

$$
\begin{aligned}
\log \left(\text { wages }_{i t}\right)= & \beta_{\mathrm{o}}+\beta_{1} \text { urt }_{i t_{\mathrm{o}}}+\beta_{2} \text { urt }_{\mathrm{it}_{\mathrm{o}}} \cdot \exp _{\mathrm{it}}+\beta_{3} \exp _{\mathrm{it}}+\beta_{4} \exp _{\mathrm{it}}^{2}+\beta_{5} \text { industry }_{i t}+\beta_{6} \text { race }_{\mathrm{i}} \\
& +\beta_{7} \text { maritalstatus }_{\text {it }}+\beta_{8} \text { gender }_{\mathrm{i}}+\beta_{9} \text { citizenship }_{\text {it }}+\epsilon_{\mathrm{it}}
\end{aligned}
$$

with $i$ denoting the individual and $t$ denoting the year of observation.
The dependent variable in the equation is wages $_{i t}$, which refers to the real monthly wage of an individual in each of his observation years. The explanatory variables are as follows: urt $_{\mathrm{it}_{0}}$ is the annual resident unemployment rate during an individual's year of entry into the labour market; $\exp _{i t}$ measures the individual's experience and is proxied by the number of years since the individual entered the labour market ${ }^{9}$; $\exp _{i t}^{2}$ is its square; $u r t_{i_{i t}} \cdot \exp _{i t}$ is the interaction of the resident unemployment rate in an individual's year of entry and his/her experience; and industry ${ }_{i t}$, , ${ }^{2} \mathrm{e}_{\mathrm{i}}$, maritalstatus ${ }_{i t}$, gender ${ }_{i}$, citizenship ${ }_{i t}$ are dummy variables used to control for various individual observable characteristics.

The key variables of interest are urt ${ }_{i t_{0}}$ and urt $_{\mathrm{it}_{0}} \cdot \exp _{i t}$. If the coefficient of urt $_{\mathrm{it}_{\mathrm{o}}}$ is negative and significant, it suggests that individuals entering the labour market under poorer economic conditions would tend to have wages that are lower than the wages of those who enter when economic conditions are better. However, as human capital accumulates over time, the disadvantage of entering the labour market under poorer economic conditions may dissipate over time. The interaction of the annual resident unemployment rate in the individual's year of entry and the individual's experience, urt ${ }_{i t_{0}} \cdot \exp _{i t}$, allows us to find out whether this occurs among university graduates in Singapore. If the coefficient of urt $\mathrm{it}_{0}$. $\exp _{i t}$ is positive and significant, we may conclude that the long-term impact of poor entry economic conditions is limited because the initial disadvantage would diminish or even disappear over time.

[^3]In addition to the explanatory variables captured in equation (1), current economic conditions may also affect wages. We therefore include the current unemployment rate, urt ${ }_{i t}$, in equation (2) to measure the relative importance of current economic conditions vis-à-vis entry economic conditions on current wages. If the coefficient of urt $_{i t}$ is negative and significant, poor current economic conditions would depress wages.

Equation (2):

$$
\begin{aligned}
\log \left(\text { wages }_{i t}\right)= & \beta_{o}+\beta_{1} \text { urt }_{i t_{o}}+\beta_{2} \text { urt }_{i t_{o}} \cdot \exp _{i t}+\beta_{3} \text { exp }_{i t}+\beta_{4} \text { exp }_{i t}^{2}+\beta_{5} \text { urt }_{i t}+\beta_{6} \text { industry }_{i t}+\beta_{7} \text { race }_{i} \\
& +\beta_{8} \text { maritalstatus }_{i \mathrm{it}}+\beta_{9} \text { gender }_{i}+\beta_{10} \text { citizenship }_{\text {it }}+\epsilon_{i t}
\end{aligned}
$$

## Self-Selection Bias

During recessions, individuals may decide to postpone their entry into the labour market voluntarily or involuntarily. In particular, cognisant of limited job opportunities during recessions, individuals who are of lower ability and are financially able to delay their entry into the labour market may choose to avoid the higher job search costs that are likely to be incurred.

Other than by choice, it is also possible that individuals of lower ability may not be able to secure a job despite looking for one, thus resulting in an involuntary delay in their entry into the labour market. Under our assumptions, a university graduate is treated as a fresh entrant to the labour market in a particular year only when he or she has a job.

By influencing the time of entry into the labour market, individual ability thus affects the entry unemployment rate and experience terms. However, individual ability also influences wages directly. As suitable proxies of individual ability, abil ${ }_{i}$, are not available, it ends up being embedded in the error term of the model specifications, $\epsilon_{i t}$, thus causing endogeneity problems. Represented mathematically, this refers to the following:

$$
\begin{gathered}
\operatorname{corr}\left(\text { urt }_{i t_{0}}, \text { abil }_{i}\right) \neq 0 \\
\operatorname{corr}\left(\exp _{\mathrm{it}}, \text { abil }_{\mathrm{i}}\right) \neq 0
\end{gathered}
$$

To overcome this problem, we instrument for entry unemployment rate and experience using indicators of exogenous timing - i.e., unemployment rate when the individual is at the modal entry age, $\bmod _{\mathrm{i}}$, and adjusted age, age $_{\mathrm{it}}$, respectively. Based on the sample, 23 is the modal entry age for females, and 26 for males. Therefore, we instrument for the entry unemployment rate using the unemployment rate in the year the individual turned 23 (for females) or 26 (for males).

As for experience, we use adjusted age as the instrument. Adjusted age is the individual's age if she is female, and the individual's age less 3 years if he is male. For males, we take 3 years off his age because the difference in the modal entry age for the two genders is 3 years. This difference is likely to reflect the National Service requirement that most resident males have to fulfil prior to entering university, rather than any inherent differences in ability between males and females. If we do not make this adjustment, the additional 3 years for males will be misinterpreted as additional experience in the labour market.

Correspondingly, the quadratic in experience is instrumented using a quadratic in the individual's adjusted age; while the interaction of the entry unemployment rate and experience is instrumented by interacting the unemployment rate at the modal entry age with the adjusted age. ${ }^{10}$

We argue that the instruments chosen are appropriate ${ }^{11}$ as they satisfy both instrument exogeneity and instrument relevance conditions:

[^4]Instrument exogeneity:

$$
\begin{aligned}
& \operatorname{corr}\left(\bmod _{\mathrm{i}}, \operatorname{abil}_{\mathrm{i}}\right)=0 \\
& \operatorname{corr}\left(\operatorname{age}_{\mathrm{it}}, \operatorname{abil}_{\mathrm{i}}\right)=0
\end{aligned}
$$

Instrument relevance:

$$
\begin{gathered}
\operatorname{corr}\left(\bmod _{i}, \text { urt }_{i_{t}}\right) \neq 0 \\
\operatorname{corr}\left(\text { age }_{i t}, \exp _{\mathrm{it}}\right) \neq 0
\end{gathered}
$$

## RESULTS AND DI SCUSSI ON

We perform three sets of regressions based on equations (1) and (2). Regression (1) is the Ordinary Least Square (OLS) estimation of equation (1). Regression (2) is the OLS estimation of equation (2), while Regression (3) is the two-stage least squares regression of equation (2). Exhibit 3 presents the coefficients for the key variables of interest. The detailed results are in Exhibit 6 of the appendix.

Exhibit 3: Coefficient Estimates for Equations

Source: Singapore Department of Statistics
From Regression (1), we find that the adverse economic conditions in an individual's entry year have a significant negative impact on wages. A 1 percentage point increase in the unemployment rate during the year of entry is associated with a wage reduction of around 6 per cent. This suggests that graduates who enter the labour market during recessions would indeed be disadvantaged compared to graduates who enter when economic conditions are better.

However, the initial disadvantage can be overcome with more experience in the labour market. As can be seen from the results, the disadvantage of entering the labour market during downturns diminishes with job experience. In fact, this disadvantage would disappear completely with at least three years of job experience.

For Regression (2), which includes the current unemployment rate as an explanatory variable, we find that adverse current economic conditions also have a significant and negative impact on wages. A 1 percentage point increase in current unemployment rate is associated with a wage reduction of around 9 per cent.

Surprisingly, the sign of the coefficient for urt $_{\mathrm{it}_{0}}$ is reversed, implying that entering the labour market during a recessionary year could have a positive impact on wages. This could be due to the selection bias discussed earlier. The endogenous timing of entry into the labour market could result in an upward bias (of the coefficient of urt $_{\mathrm{it}_{0}}$ ) because individuals who are willing and able to enter the labour market during an economic downturn are likely to be those of higher ability who would garner higher wages. By instrumenting for entry unemployment rate and experience in Regression (3), we expect the sign of the coefficient for urt $\mathrm{it}_{\mathrm{o}}$ to revert to negative.

In Regression (3), the coefficient for urt $_{\text {it }_{\mathrm{t}}}$ indeed becomes negative and significant. A 1 percentage point increase in entry unemployment rate reduces entry wages by 8 per cent. However, job experience helps to mitigate the initial disadvantage. After three years in the labour market, a graduate who entered the labour market during a downturn would enjoy a current wage similar to another graduate who entered under better economic conditions. Compared to Regression (2), a 1 percentage point increase in current
unemployment rate has a smaller effect, reducing wages by 6 per cent. ${ }^{12}$
Our results are similar to those of Kahn (2010). She finds an initial wage loss of 6 to 7 per cent for a 1 percentage point increase in entry unemployment rate in the United States. While this initial impact is smaller in magnitude compared to what we found for Singapore, her estimation also shows that the negative impact would decrease by only 0.4 percentage points each year. This means that in the United States, individuals who enter the labour market under poor economic conditions continue to be disadvantaged for almost 18 years after graduation, or around six times what it would take for the recovery to occur in Singapore.

Given current data constraints, it is impossible for us to determine conclusively the key factors that would have contributed to the quicker recovery in wages in Singapore. However, we postulate two possible reasons. First, compared to their counterparts in the United States, university graduates in Singapore may have greater job mobility. Second, the wage structure in Singapore may have more variable and performance-linked components. Under such a wage structure, it may be easier for 'unlucky' graduates who enter during recessions and end up acquiring less transferable skills to catch up with their luckier peers by taking advantage of continuing education and training (CET) opportunities.

## SI MULATI ON OF POTENTI AL LOSS I N WAGES

To estimate the size of the potential disadvantage that will be suffered by an individual who enters the labour market during a recession, we simulate the cumulative losses in potential earnings over the threeyear period needed for the disadvantage to dissipate. ${ }^{13}$ We derive the losses based on the difference between his earnings and that of his counterpart who entered the labour market during a normal year.

We assume that the graduate who entered the labour market during a normal year would receive a real monthly starting wage of $\$ 2,700$. ${ }^{14}$ We further assume that a mild recession is marked by a rise in the annual resident unemployment rate of 1.1 percentage points. ${ }^{15}$ However, if the economy were to be in a more severe recession, the annual unemployment rate would rise by 1.5 percentage points. ${ }^{16}$

Our simulation shows that by the time the wage of the graduate who entered the labour market during a mild recession catches up with that of his counterpart who entered during a normal year, the 'unlucky' graduate would have potentially incurred a total wage loss of $\$ 4,000$. However, if he had entered during a more severe recession, he would incur a slightly larger potential loss of \$5,500 (Exhibit 4).

## Exhibit 4: Potential Loss in Wages of New Entrant in a Recessionary Year

[^5]
## CONCLUSION

This paper contributes to existing research on the effect that entering the labour market during adverse economic conditions has on workers by investigating its impact on the wages of university graduates in Singapore.

In summary, our results suggest that university graduates in Singapore who enter the labour market when economic conditions are poor would suffer an initial wage loss. However, this negative impact would diminish over time and fully disappear after three years in the labour market. Singapore's labour market would thus appear to be efficient enough to prevent the perpetuation of downward wage persistence for 'unlucky' cohorts of graduates.

There are several caveats to our study. First, due to the short timeframe of the longitudinal data, the study covers only one recession between 2000 and 2007. Furthermore, as the wage data for many of the graduates in the dataset span less than four years, we are unable to observe how 'unlucky' cohorts of graduates do vis-à-vis their 'luckier' peers after their wages have caught up with the latter's. We cannot rule out the possibility that entry economic conditions could have long-term negative effects not captured within the period of observation. In fact, the period of observation for similar studies conducted overseas tends to be much longer at 12-22 years. Hence, there may be merit in re-running the analysis in this paper when a longitudinal dataset with a longer timeframe becomes available in future to see if the conclusions remain valid.

Second, it is possible that the wage persistence effect is different for people of differing abilities. Oreopoulos et al. (2006) find that high-skilled workers can catch up quickly by moving on to better firms, whereas low-skilled workers are permanently down-ranked to firms paying lower wages and may consequently never catch up. However, as information on individual ability and job switches is not available currently, we are unable to assess whether recessions affect various segments of university graduates differently. ${ }^{17}$

Future studies could attempt to examine the mechanisms of wage recovery for various segments of labour market entrants. Such studies would enable more targeted policy interventions to reduce the disadvantage suffered by 'unlucky' entry cohorts to be considered.

Notes: 1 The industries are classified according to SSIC 2005.
Source: Manpower Research \& Statistics Department,
2 Others comprise Agriculture, Fishing, Quarrying, Utilities, Sewerage and Waste Management.
3 Business Services comprise Real Estate \& Leasing, Professional Services and Administrative \& Support Services.
4 Data by industry from 4Q 2010 onwards are not strictly comparable with earlier periods, due to the nation-wide implementation of the Unique Entity Number (UEN) for enterprises.
5 Data in the table may not necessarily add up to the total due to rounding.

Notes: 1 Figures exclude Malaysian arrivals by land.
2 The term "ASEAN" stands for "Association of South East Asian Nations" and refers to the ten-country
political association comprising Brunei, Cambodia, Indonesia, Philippines, Laos, Malaysia, Myanmar,
Singapore, Thailand and Vietnam. However, when used in the statistical tables, the term excludes Singapore.

${ }^{1}$ Operating revenue refers to receipts credited to the Consolidated Revenue Account and Development Fund Account,
Source: Ministry of Finance
but excludes interest income, investment income and capital receipts.
${ }^{2}$ This refers to collection under Section 45 of the Income Tax Act which is a Withholding Tax on locally-sourced income earned by non-residents. The Withholding Tax collection was previously included in the figures reported under Personal Income Tax.
${ }^{3}$ Taxes on Motor Vehicles comprise additional registration fees, road tax, special tax on heavy-oil engines, passenger vehicle seating fees and non-motor vehicle licences, but exclude excise duties on motor vehicles which are classified under Customs and Excise Duties.
${ }^{4}$ With effect from March 2010, Betting Taxes include casino tax collected under Section 146 of the Casino Control Act.
${ }^{5}$ To more accurately reflect the nature of "Development Charges (DC)" as a tax under section 35 of the Planning Act, reporting of actual collection of DC has been reclassified from "Fees and Charges" to "Tax Revenue : Others" with effect from April 2009.
${ }^{6}$ Other receipts exclude repayment of loans and advances, interest income, investment income and capital receipts. Figures may not add up due to rounding.

${ }^{2}$ Re-classified from Info-Communications Technology to include expenditure related to Media Development Programme from April 2007 onwards.
Figures may not add up due to rounding

[^0]:    ${ }^{1}$ EDB has refined the definition for TBS to exclude depreciation. As capital investments are accounted for in FAI, excluding depreciation from TBS will allow the TBS to more accurately reflect investments that are not linked to fixed assets in both manufacturing and services clusters. For 2011, EDB will report both TBS and TBS less depreciation. From 2012 onwards, only TBS less depreciation will be reported.

[^1]:    ${ }^{1}$ Glyde (1977) defines underemployment as "an involuntary employment condition where workers are in jobs in which their skills, including formal and work experience training, are technically underutilized and thus undervalued relative to those of other individuals of similar ability who have made equivalent investments in skill development".

[^2]:    ${ }^{2}$ Those with postgraduate education or who are self-employed are excluded.
    ${ }^{3}$ We consider three cut-off ages - 25, 28 and 30 years old. When the cut-off age is raised from 25 to 28 , the sample size more than doubles. Comparatively, the sample size increases on average by only 10 per cent when the cut-off age is raised from 28 to 30. Therefore, the cut-off age of 28 is deemed to be reasonable as it would capture most individuals who graduated with their first degree.
    ${ }^{4}$ Individuals who passed away or left the country during the period of observation are removed from the sample. If an individual did not have wage data for any of the years within the period of observation, his or her wage would be recorded as zero for that year, but he or she would still be retained in the sample.
    ${ }^{5}$ We use resident unemployment rates instead of unemployment rates for degree holders because we do not want to pick up influences from cohort-specific changes in the labour supply of university graduates. We use resident unemployment rates instead of overall unemployment rates because our analysis focuses on residents, and we want to exclude the effects of foreign manpower. ${ }^{6}$ See for instance Kahn (2010) and Brunner and Kuhn (2009).

[^3]:    ${ }^{7}$ The nominal mean monthly gross starting salary of university graduates is available from the Ministry of Manpower's Report on Wages in Singapore starting from 2003 onwards. The nominal wage data has been deflated to 2000's dollar value using the consumer price index.
    ${ }^{8}$ This empirical strategy is also similar to Oreopoulos et al. (2006).
    ${ }^{9}$ Therefore, $\exp _{i t}=t_{i}-t_{i_{0}}$. This term does not take into account the possibility that an individual may be unemployed for certain durations after he has entered the labour market.

[^4]:    ${ }^{10} \mathrm{~A}$ similar strategy is used in Kahn (2010). Furthermore, the Shea's partial R-squared value shows that there are indeed endogeneity issues with the entry unemployment rate variable and the year of experience variable.
    ${ }^{11}$ The first stage results show that the instruments used satisfy the instrument relevance conditions.

[^5]:    ${ }^{12}$ We attempt to examine how the rate of recovery differs across time by specifying a regression model containing a non-linear interaction term, $\operatorname{urt}_{i t_{o}} \cdot \exp _{i t}^{2}$. Under this specification, the coefficient of $u r t_{i t_{o}} \cdot \exp _{i t}$ becomes statistically insignificant and negative, whereas the coefficient of $u r t_{i t_{o}} \cdot \exp _{i t}^{2}$ is statistically significant and positive, which suggest that the wage catch-up accelerates with job experience. These results could have come about because the instruments that we have used are unable to completely correct for the endogeneity caused by ability.
    ${ }^{13}$ The exact time period needed for the disadvantage to dissipate is 2.8 years.
    ${ }^{14}$ This level of real monthly wage is derived as the average of real starting wages in years where the resident unemployment rate is similar to the historical average resident unemployment rate.
    ${ }^{15}$ In the recent financial crisis, the resident unemployment rate increased by 1.1 percentage points from 3.2 per cent in 2008 to 4.3 per cent in 2009. For the economic downturn in 2002, the resident unemployment rate also increased by 1.1 percentage points from 3.7 per cent in 2001 to 4.8 per cent in 2002.
    ${ }^{16}$ Resident unemployment rate rose by 1.5 percentage points between 1997 and 1998 as a result of the Asian Financial Crisis. This represents the largest change in resident unemployment rate between any two consecutive years since 1991.

[^6]:    ${ }^{17}$ In Oreopoulos, von Wachter and Heisz (2006), college and programme of graduation are used to proxy for the ability of individuals. However, this approach cannot be used in Singapore's context because most university graduates are enrolled in the three public universities. Also, these three universities focus on different academic disciplines. Therefore, it is inappropriate to infer the individual's ability from the university he/she attended.

[^7]:    ${ }^{18}$ There are some individuals who entered the labour force at ages younger than the modal age of entry. For the later cohorts especially, the $\bmod _{i}$ instrument, which is the unemployment rate when the individual is at the modal age, would require an unemployment rate beyond 2010, which is not available. Therefore, observations from these individuals have to be dropped from the sample.

[^8]:    Note: The industries are classified according to SSIC 2005.

[^9]:    ${ }^{1}$ Closing bid rates quoted by SGS primary dealers.
    ${ }^{2}$ Closing offer rates.
    ${ }^{3}$ Refer to the average quoted by 10 leading banks.
    ${ }^{4}$ Refer to the average quoted by 10 leading finance companies.

[^10]:    Note: Data prior to 2007 are based on SITC (Revision 3). From January 2007 onwards, data are based on SITC (Revision 4).

[^11]:    Note: Data prior to 2007 are based on SITC (Revision 3). From January 2007 onwards, data are based on SITC (Revision 4),

[^12]:    ${ }^{1}$ Increase in assets is indicated by a minus (-) sign.

[^13]:    ${ }^{1}$ The weights are used in the computation of the indices from 2010 onwards.

[^14]:    ${ }^{1}$ Excluding non-bank customers' holdings of Singapore Dollar negotiable certificates of deposit.
    ${ }^{2}$ Including Asian Currency Units.

[^15]:    Note: "Net weighted balance" is the difference between the weighted percentages of "ups" and "downs"

[^16]:    ${ }^{1}$ Government operating expenditure refers to expenditure on manpower, other operating expenditure (excluding expenses on investment and agency fees on land sales) and operating grants.
    Re-classified from Info-Communications Technology to include expenditure related to Media Development Programme from April 2007 onwards. Figures may not add up due to rounding.
