## CHAPTER 1

## THE SI NGAPORE ECONOMY

## OVERVIEW

In the second quarter of 2013,

- The economy grew by 3.8 per cent compared to the same period in 2012.
- Growth was mainly supported by the finance \& insurance, wholesale \& retail trade and business services sectors.
- Employment grew by 32,500, while the overall unemployment rate increased to 2.1 per cent.
- The consumer price index increased by 1.6 per cent compared to a year ago.

## OVERALL PERFORMANCE

- The economy grew by 3.8 per cent in the second quarter, an improvement from the 0.2 per cent growth in the first quarter. On a quarter-on-quarter seasonally adjusted annualised basis, the economy expanded by 15.5 per cent, significantly higher than the 1.7 per cent growth in the previous quarter.
- All major sectors registered positive growth. The finance \& insurance sector expanded by 13 per cent, while the wholesale \& retail trade and construction sectors grew by 5.6 per cent and 5.1 per cent respectively. The manufacturing sector grew marginally by 0.2 per cent.
- The main drivers of growth in the second quarter were the finance \& insurance, wholesale \& retail trade and business services sectors, which added 1.6 percentage-points, 0.8 percentage-points and 0.4 percentage-points to overall GDP growth respectively.

Exhibit 1.1: GDP and Sectoral Growth Rates in 2Q 2013

Exhibit 1.2: Percentage-Point Contribution to Growth in Real GDP in 2Q 2013 (By I ndustry)

## SOURCES OF GROWTH

- Total demand increased by 3.1 per cent in the second quarter, a reversal from the 1.7 per cent contraction in the first quarter.
- Both external demand and domestic demand increased in the second quarter. External demand rose by 3.1 per cent, recovering from the 4.1 per cent contraction in the preceding quarter, while domestic demand grew by 3.4 per cent, moderating from the 5.8 per cent growth in the previous quarter.
- Growth in domestic demand was mainly attributable to the 4.1 per cent increase in consumption expenditure, which was in turn supported by the 12 per cent growth in public consumption expenditure.
- Gross fixed capital formation shrank by 3.8 per cent, the second consecutive quarter of decline following the contraction of 5.8 per cent in the first quarter. The pace of decline slowed as the contraction in private investments eased to 4.1 per cent, from the contraction of 7.3 per cent in the previous quarter.
- Inventories continued to increase by 1.7 per cent, contributing 0.6 percentagepoints to the growth in total demand.

Exhibit 1.4: Percentage-Point Contribution to Total Demand Growth

## LABOUR MARKET

## Employment

- Total employment grew by $32,500^{1}$ in the second quarter of 2013, higher than the gains of 28,900 in the preceding quarter, and the gains of 31,700 in the second quarter of 2012.
- Services added 21,700 new workers, up from the gains of 17,300 in the second quarter of 2012. Construction and manufacturing added 8,900 and 2,000 new workers respectively, lower than the gains of 9,700 and 4,700 in the same period a year ago.

## Unemployment

- The seasonally-adjusted overall unemployment rate increased from 1.9 per cent in March to 2.1 per cent in June this year. The seasonally-adjusted resident and citizen unemployment rates increased by 0.1 and 0.2 percentage-points respectively, to 3.0 per cent and 3.1 per cent over the same period.
- An estimated 83,000 residents, including 72,700 Singapore citizens, were unemployed in June 2013. The seasonally-adjusted figures were 63,500 for residents and 56,000 for citizens.

## Redundancy ${ }^{2}$

- Layoffs increased in the second quarter of 2013 to 2,900, from 2,120 in the first quarter. Redundancies rose in the manufacturing sector, from 680 in the first quarter to 1,400 . Similarly, redundancies in the construction sector increased from 130 in the first quarter to 300. The services sector was the only sector to see a reduction in redundancies, from 1,300 in the first quarter to 1,200 .

Exhibit 1.5: Change in Total Employment

Exhibit 1.6: Seasonally-Adjusted Overall, Resident and Citizen Unemployment Rates

Exhibit 1.7: Redundancy by Sector

[^0]
## COMPETI TI VENESS

## Productivity

- Labour productivity declined by 0.3 per cent in the second quarter compared to the same period a year ago, following the 3.8 per cent decline in the first quarter.
- Finance \& insurance (10 per cent) and wholesale \& retail trade (3.5 per cent) were the only sectors to register productivity gains. The sectors with the sharpest declines in productivity were construction (-3.7 per cent), transportation \& storage (-2.4 per cent) and accommodation \& food services (-2.2 per cent).

## Unit Labour Cost and Unit Business Cost

- Overall unit labour cost (ULC) for the economy increased by 3.9 per cent in the second quarter compared to the same period a year ago. This increase was smaller than the 8.5 per cent increase in the previous quarter.
- Manufacturing ULC rose by 5.1 per cent, lower than the increase of 13 per cent in the previous quarter. The slower rise in the manufacturing ULC was largely due to an improvement in the productivity performance of the manufacturing sector.
- Unit business costs (UBC) in the manufacturing sector increased by 1.7 per cent in the second quarter, following the 5.2 per cent gain in the previous quarter.
- The slower rise in the manufacturing UBC was mainly driven by the smaller increase in the manufacturing ULC. In addition, growth in services cost moderated, largely due to a decline in utilities fees.

Exhibit 1.8: Changes in Labour Productivity for the Overall Economy and Sectors in 2Q 2013

Exhibit 1.9: Change in Unit Labour Cost

Exhibit 1.10: Percentage-Point Contribution to Change in Unit Business Costs for Manufacturing

## Investment Commitments

- Investment commitments in terms of total fixed asset investments (FAI) and total business expenditure (TBE) amounted to $\$ 2.3$ billion and $\$ 2.2$ billion respectively in the second quarter.
- The services clusters collectively accounted for more than half of the FAI committed (\$1.2 billion). Among the services clusters, the information communications \& media cluster attracted the highest amount of commitments, at $\$ 0.7$ billion. The chemicals cluster garnered $\$ 0.5$ billion in FAI, the largest among the manufacturing clusters.
- In terms of TBE, the headquarters \& professional services cluster attracted the largest amount of commitments, at \$548 million. The transport engineering cluster came next, with $\$ 525$ million of TBE.
- Europe was the biggest foreign contributor to FAI, accounting for 30 per cent of total FAI. By contrast, the United States was the biggest foreign contributor to TBE, contributing 28 per cent of total TBE.
- When fully realised, these FAI and TBE commitments are expected to generate $\$ 4.8$ billion in value-added and more than 7,000 skilled jobs.

## PRICES

## Consumer Price I ndex

- The consumer price index (CPI) rose by 1.6 per cent on a year-on-year basis in the second quarter, lower than the 4.0 per cent increase in the preceding quarter. On a quarter-on-quarter seasonally-adjusted basis, the CPI declined by 1.2 per cent, compared to the 1.3 per cent increase in the previous quarter.
- Housing costs were the biggest contributor to CPI inflation, rising by 2.5 per cent on a year-on-year basis. This was due to higher accommodation costs which more than offset lower electricity tariffs.

Exhibit 1.11: Fixed Asset I nvestments by I ndustry Cluster in 2Q 2013

Exhibit 1.12: Total Business Spending by I ndustry Cluster in 2Q 2013

Exhibit 1.13: Changes in CPI

- Food prices went up by 2.0 per cent, on account of more expensive prepared meals, dairy products \& eggs, vegetables, fruits, seafood and rice \& other cereals.
- The cost of "Recreation \& others" rose by 2.7 per cent, owing to the higher cost of employing foreign domestic helpers, which more than offset lower holiday travel costs.
- Healthcare costs increased by 4.0 per cent as a result of costlier medical treatment fees, premiums for medical health insurance and proprietary medicines.
- Education \& stationery costs increased by 2.9 per cent, driven by higher school fees as well as higher fees at commercial institutions, universities, polytechnics, childcare centres, kindergartens and playgroups.
- Clothing \& footwear costs rose by 0.5 per cent due to more expensive ready-made garments, while transport costs declined by 1.3 per cent on the back of cheaper cars and petrol.

## EXTERNAL BALANCE

## Trade

- Total trade in nominal terms contracted by 2.0 per cent in the second quarter. In volume terms, total trade grew by 2.4 per cent, compared to the 3.9 per cent decline in the previous quarter.
- Total exports fell by 0.1 per cent, following a decline of 8.7 per cent in the previous quarter. Total exports was weighed down by domestic exports which declined by 7.1 per cent. Re-exports, on the other hand, registered a 9.1 per cent increase.
- Within domestic exports, both oil and non-oil domestic exports contracted. Oil domestic exports declined by 11 per cent, while non-oil domestic exports decreased by 4.9 per cent.

Exhibit 1.14: Percentage-Point Contribution to Change in Overall CPI in 2Q 2013

Exhibit 1.15: Growth Rates of Total Trade, Exports and I mports (In Nominal Terms)

- Total imports fell by 4.0 per cent, with declines seen in both non-oil imports and oil imports. Within non-oil imports, nonelectronic imports declined by 4.0 per cent, while electronic imports increased by 4.5 per cent. Oil imports decreased by 10 per cent.

## Balance of Payments

- The overall balance of payments recorded a smaller surplus of $\$ 5.4$ billion in the second quarter, compared with $\$ 8.7$ billion in the first quarter.
- This was due to an increase in the net deficit in the capital and financial account, which more than offset the higher current account surplus.

## Current Account

- The surplus in the current account balance continued to widen in the second quarter, increasing to $\$ 18$ billion from $\$ 14$ billion in the previous quarter. This was also $\$ 5.2$ billion higher than the trough reached in the last quarter of 2012.
- The larger current account surplus in the second quarter was primarily driven by the $\$ 5.0$ billion increase in the net exports of goods.
- In contrast, the services balance registered a slight deficit of $\$ 0.6$ billion, after turning in a small surplus of $\$ 0.8$ billion in the first quarter. This mainly reflected smaller net receipts from transport services, and larger net payments for travel services.
- Changes in the primary and secondary income accounts were small compared to those in the goods and services accounts. Net primary income payments contracted by a marginal $\$ 0.3$ billion, while net secondary income payments increased by $\$ 0.1$ billion in the second quarter.

Exhibit 1.16: Balance of Payments

## Capital and Financial Account

- The net deficit in the capital and financial account tripled to $\$ 14$ billion in the second quarter.
- This was largely due to a sharp reversal in the "other investment" account from a net inflow to a net outflow position. This in turn reflected increased gross outflows from the domestic banking sector (deposit-taking corporations), with gross inflows remaining broadly unchanged.
- The fall in net inflows of direct investment also contributed to the larger net deficit in the financial account. Foreign direct investment into Singapore experienced a fairly substantial decline in the second quarter, while residents' direct investment overseas remained stable.
- In comparison, there was a reduction in the net outflow of portfolio investment. This was largely due to the pullback in resident banks' holdings of foreign securities.

## CHAPTER 2

## PERFORMANCE OF SELECTED SECTORS

## OVERVIEW

In the second quarter of 2013,

- The manufacturing sector expanded by 0.2 per cent, supported by growth in the biomedical manufacturing and electronics clusters.
- The transportation and storage sector grew by 2.5 per cent on the back of a recovery in the water transport segment.
- The accommodation and food services sector posted growth of 3.2 per cent, bolstered by the improved performance of the accommodation segment.
- Growth of the business services sector came in at 3.7 per cent, supported by the professional services segment.

## MANUFACTURING

- The manufacturing sector grew by 0.2 per cent in the second quarter, a reversal from the 6.7 per cent contraction in the previous quarter.
- The biomedical manufacturing cluster expanded by 7.5 per cent. In particular, the medical technology segment surged by 15 per cent on the back of higher production capacities and strong export demand, while the pharmaceuticals segment grew by 6.1 per cent.
- The general manufacturing cluster posted growth of 3.6 per cent. Growth was supported by the miscellaneous segment, which expanded by 10 per cent due to higher output of construction-related products. By contrast, the printing segment contracted by 6.8 per cent.
- The electronics cluster grew by 1.9 per cent on the back of higher export demand. In particular, the other electronic modules \& components, computer peripherals, and semiconductors segments saw robust growth of 37 per cent, 12 per cent and 6.1 per cent respectively.
- The chemicals cluster contracted by 1.9 per cent, with all segments registering declines. In particular, the petroleum segment shrank by 6.0 per cent as a result of maintenance shutdowns.

Exhibit 2.1: Manufacturing Growth Rates

Exhibit 2.2: Percentage-Point Contribution to Manufacturing Sector's Growth in 2Q 2013

- The transport engineering cluster shrank by 3.3 per cent. Growth was dragged down by the marine \& offshore engineering segment which contracted by 4.9 per cent as a result of lower contributions from rig building and ship building \& conversion activities. The aerospace segment also contracted by 2.7 per cent.
- The precision engineering cluster shrank by 11 per cent. The decline was led by the machinery \& systems segment which contracted by 13 per cent due to weak export demand. The precision modules \& components segment also saw a decline of 7.8 per cent.

## TRANSPORTATI ON \&

 STORAGE- The transportation and storage sector grew by 2.5 per cent in the second quarter, reversing the 0.9 per cent decline in the previous quarter.
- The improvement came on the back of a recovery in the water transport segment. Specifically, total sea cargo expanded by 5.0 per cent in the second quarter, reversing the 6.5 per cent contraction in the preceding quarter.
- On the other hand, growth of air passenger traffic moderated to 4.9 per cent in the second quarter, compared to 6.0 per cent in the first quarter. The moderation came on the back of weaker travel demand in Europe and US.

Exhibit 2.3: Changes in Container Throughput and Sea Cargo Handled

Exhibit 2.4: Changes in Air Transport

## ACCOMMODATI ON \& FOOD SERVI CES

- The accommodation and food services sector expanded by 3.2 per cent in the second quarter, following the 2.6 per cent growth in the preceding quarter.
- Growth of the accommodation segment was supported by higher gross lettings of gazetted hotels. The latter rose by 6.1 per cent to reach 2.8 million room nights in the second quarter. Average occupancy rates of gazetted hotels also remained high, at 86 per cent, while hotel revenue rose to $\$ 718$ million. The better performance of the accommodation segment was supported by healthy visitor arrivals. In the second quarter, Singapore received 3.8 million visitors, an increase of 7.5 per cent from a year ago.
- The food and beverage services index rose by 1.5 per cent in the second quarter, faster than the 0.7 per cent growth in the previous quarter. Growth was supported primarily by the restaurant sub-segment (2.9 per cent).

Exhibit 2.5: Gross Letting (Room Nights)

Exhibit 2.6: Changes in Food and Beverage Services Index at Constant Prices

## BUSI NESS SERVI CES

- The business services sector expanded by 3.7 per cent in the second quarter, similar to its pace of growth in the previous quarter. ${ }^{1}$ Growth was supported by faster expansion in the professional services segment due to steady demand for architectural and engineering services.
- Growth of the real estate segment moderated in the second quarter, as total private home sales contracted by 32 per cent year-on-year following the seventh round of cooling measures introduced at the beginning of the year. However, private residential property prices remained firm, rising by 4.1 per cent year-on-year in the second quarter, faster than the 3.5 per cent increase in the preceding quarter.
- Office occupancy rates climbed to 91 per cent in the second quarter, the highest level reached since the fourth quarter of 2008. However, office rentals continued to decline, albeit at a more moderate pace in the second quarter ( -0.4 per cent) as financial institutions optimised their space use. In particular, while office rentals in the central area continued to decline ( -0.3 per cent), rentals in the fringe areas rose ( 0.3 per cent).
- For the shop space segment, occupancy rates eased to 93 per cent in the second quarter. Shop rentals declined in both the central ( -2.0 per cent) and fringe ( -0.5 per cent) areas.
- Similarly, occupancy rates for private factory space moderated to 92 per cent in the second quarter. While private multiple-user factory rentals rose by 4.7 per cent, this was lower than the 8.7 per cent increase recorded in the previous quarter.

[^1]
## ECONOMI C OUTLOOK

## LEADI NG I NDI CATORS

- In the second quarter of 2013, the composite leading index (CLI) rose by 0.2 per cent on a quarter-on-quarter basis, following the 0.4 per cent increase in the preceding quarter.
- Three of the nine components within the CLI increased, namely new companies formed, money supply, and non-oil sea cargo handled.
- Indicators that declined were non-oil retained imports, US Purchasing Managers' Index, stock of finished goods, wholesale trade and stock price, while domestic liquidity was flat.

Exhibit 3.1: Composite Leading I ndex Levels and Growth Rate

## CONCLUSION

Singapore's GDP grew at a faster pace in the second quarter of 2013. On a year-on-year basis, the economy grew by 3.8 per cent, compared to 0.2 per cent in the previous quarter. On a quarter-onquarter seasonally-adjusted annualised basis, the economy grew by 15.5 per cent, significantly faster than the 1.7 per cent expansion in the previous quarter. The acceleration in quarter-on-quarter growth momentum was mainly due to robust growth in the manufacturing, wholesale \& retail trade, transportation \& storage, and finance \& insurance sectors.

While economic growth in the advanced economies was slightly weaker than expected in the first half of the year, leading indicators point to a gradual pickup in external macroeconomic conditions in the second half. The US economy is expected to grow modestly, supported by private domestic demand. The Eurozone is expected to remain in recession but improving sentiments and economic activity suggest a potential easing of the downturn in the coming months. In Asia, the growth outlook for China looks fragile as recent policies to rein in credit expansion could potentially weigh on investments. For the ASEAN economies, growth is likely to remain modest, supported by resilient domestic demand.

Against this macroeconomic backdrop, the growth outlook for the Singapore economy is expected to improve slightly. Externally-oriented sectors like manufacturing and transportation \& storage are likely to provide support to growth, in line with the gradual pickup in the global economy. Domestically-oriented sectors such as construction and business services are also expected to remain resilient.

Nonetheless, risks to the global growth outlook remain. As China adjusts its policies to promote more sustainable growth, unintended consequences, such as an excessive tightening of liquidity, could lead to a sharp slowdown in growth. This could in turn have spill-over effects on other export-oriented Asian economies. In the US, it is unclear whether markets will adjust to a tapering of the quantitative easing programme in an orderly fashion. Barring these downside risks, the Singapore economy is expected to grow by 2.5 to 3.5 per cent in 2013.

## FEATURE ARTICLE

SINGAPORE'S MISSING CAPITAL: ARE LOW-SKILLED FOREIGN WORKERS SUBSTITUTES FOR MACHINERY?

## SINGAPORE'S MISSING CAPITAL: ARE LOWSKILLED FOREIGN WORKERS SUBSTITUTES FOR MACHINERY? ${ }^{1}$

## EXECUTIVE SUMMARY

- This study finds that low-skilled foreign workers (FWs) were used as substitutes for machinery in the manufacturing sector during the recent period of FW policy liberalisation from 2003 to 2008. Over this period, the increase in employment of low-skilled FWs had caused manufacturing firms to reduce their machinery intensity. This would in turn have likely dampened the firms' productivity growth.
- Smaller manufacturing firms were found to be more prone to this substitution effect, having lowered their machinery intensity by twice as much as the average firm for a given increase in their ratio of low-skilled FWs.
- While low-skilled FWs were found to be substitutes to machinery, their overall impact on manufacturing firms' machinery intensity over the period of 2003 to 2008 was small. This suggests that apart from tightening FW policies to boost machinery intensity and hence productivity, other measures to improve productivity, such as helping firms to focus on R\&D and product innovation, are also necessary.

The views expressed in this paper are solely those of the authors and do not necessarily reflect those of the Ministry of Trade and Industry or the Government of Singapore.

## INTRODUCTION

As a resource-scarce country in a fast-growing region, Singapore faces several supply-side constraints to its economic growth, the chief of these being labour constraints. The Total Fertility Rate (TFR) of Singapore citizens has been below replacement rate for more than three decades and this 'baby deficit', coupled with longer life expectancies, has resulted in an ageing and shrinking citizen population. Consequently, the citizen workforce growth has declined and is expected to stagnate beyond 2020.

Historically, the government had turned to permanent and transient immigrant workers to augment the citizen workforce and support economic growth. The most recent period of foreign worker (FW) policy liberalisation was between 2003 and 2008, when the dependency ratio ceiling (DRC) was raised to 65 per cent, levies for unskilled Work Permit Holders (WPH) were reduced and firms were allowed to hire WPHs from the People's Republic of China.

While access to FWs helps to lower costs for firms and boost economic growth, the conventional wisdom is that easy access to cheap, low-skilled FWs also discourages firms from investing in automation and capital, which would in turn dampen their productivity growth. ${ }^{2}$ This is especially since aggregate statistics for the manufacturing sector show that the employment of FWs had increased between 2003 and 2008, whereas machinery per worker had declined. As many factors could have affected both machinery investment and the hiring of FWs concurrently, this study attempts to examine whether there is indeed a causal relationship between the employment of low-skilled FWs and machinery intensity among firms in the manufacturing sector.

The rest of the article is organised as follows. The next section covers a review of the literature on the substitutability between low-skilled workers and capital. Thereafter, we describe the methodology and data used for the study, before presenting our results and discussing the implications of our findings. The final section concludes.

[^2]
## LITERATURE REVIEW

The literature on the relationship between workers and capital is focused on the impact of skills-biased technological change. Economists generally believe that technological changes like the advent of computers have boosted the employment and earnings of skilled workers, and led to a substitution away from less skilled workers (e.g., clerical workers). ${ }^{3}$ While many researchers have attempted to ascertain the causal impact of technological change on workers, less work has been done on testing the causal relationship between low-skilled workers and the adoption of technology.

Lewis (2011) tested this relationship by exploiting the differences in low-skilled immigrant inflows (and hence low-skilled labour supply) in various metropolitan areas in the US. He argues that these immigration patterns were driven by the tendency of immigrants to congregate in areas with historically large bases of immigrants, and hence were independent of the economic conditions in these areas. ${ }^{4}$ This then allowed him to conclude that an increase in the supply of low-skilled workers caused (i) a slower adoption of advanced technology; and (ii) a decline in capital intensity (capital stock per worker) among manufacturing firms in the US.

## METHODOLOGY AND DATA

We estimate the causal effect of changes in the relative employment of low-skilled FWs on manufacturing firms' machinery intensity in Singapore over the period of 2003 to 2008 (the recent period of FW liberalisation in Singapore). ${ }^{5}$ Our econometric model is based on Lewis (2011), except that we examine a subset of low-skilled workers (i.e. low-skilled FWs). Our regression specification is as follows: ${ }^{6}$

$$
\ln \left(\Delta \frac{K_{M}}{L+H}\right)_{i}=\beta_{0}+\beta_{1}\left(\Delta \frac{L_{F}}{H}\right)_{i}+\beta_{v} X_{i}+\varepsilon_{i}
$$

Where:
$\Delta$ - Change over the period of 2003 to 2008
$i$ - A firm in our sample
$K_{M}$ - Net book value of machinery, in dollars
$H$ - Number of high-skilled production workers, defined as workers with a diploma ${ }^{7}$
$L$ - Number of low-skilled production workers, defined as workers with qualifications below a diploma
$L_{F}$ - Number of low-skilled FWs, defined as FWs with qualifications below a diploma
$X$ - Other firm level variables such as revenue (see Annex A for full list of variables)
However, running a simple regression of machinery intensity on low-skilled FW intensity leads to two key biases that prevent a causal interpretation:
i. Omitted variable bias: In a simple regression, we can only control for factors that firms report such as revenue and export intensity. However, there are factors that affect both machinery intensity and the hiring of FWs which firms do not report. For instance, managerial quality and innovation, which we cannot measure, affect both investment decisions (and thus machinery intensity) and the choice of workers that a firm hires. By excluding these unobserved variables, the coefficient for the ratio of low-skilled FWs could end up picking up the effect of managerial quality and innovation on machinery

[^3]intensity as well, leading to a biased result. For example, if poor management quality leads to both lower machinery intensity and a higher ratio of low-skilled FWs, a negative coefficient for the ratio of low-skilled FWs may be due to management quality rather than the increased employment of low-skilled FWs.
ii. Reverse causality: While increases in the employment of low-skilled FWs could affect investments in machinery, the reverse might also be true. For example, (i) some firms which invest in modern machinery might require certain types of FWs to operate them; or (ii) firms which invest in more machines could hire less FWs because their processes are less labour intensive. If reverse causality is present, it would be difficult to determine whether and to what extent changes in the employment of low-skilled FWs caused changes in machinery intensity.

To deal with these two issues, we employ two econometric techniques that are widely used in the academic literature:
i. Olley and Pakes's (1996) technique to correct for omitted variable bias: While we are not able to observe factors like managerial quality, these factors have been found to affect firms' investment decisions. For instance, we may expect good managers to purchase more machinery and non-machinery types of capital. As such, we may use firms' investment behaviour, which we observe, to proxy for managerial quality and other unobserved factors. In our study, we use a polynomial of the change in firm-level investments in non-machinery capital ( $\Delta I_{O}$ ) and non-machinery capital stock ( $\Delta K_{O}$ ) as a proxy (henceforth Olley-Pakes), in line with the academic literature: ${ }^{8}$

$$
\ln \left(\Delta \frac{K_{M}}{L+H}\right)_{i}=\beta_{0}+\beta_{1}\left(\Delta \frac{L_{F}}{H}\right)_{i}+\beta_{v} X_{i}+f\left(\Delta I_{O_{i}}, \Delta K_{O_{i}}\right)+\varepsilon_{i}
$$

ii. Instrumental Variable (IV) to correct for reverse causality: This technique requires an additional variable which affects the employment of low-skilled FWs, but does not affect machinery intensity, except through the employment of low-skilled FWs. In our study, we use the dependency ratio (DR) of individual firms in 2001 as the IV. Firms with a higher DR in 2001 would be less able to hire low-skilled FWs from 2003 to 2008 because (i) they were closer to the DRC and hence had a smaller usable FW quota; and (ii) as levies are tiered, their cost per FW would likely be higher as compared to firms with a lower DR. At the same time, we do not expect the initial DR in 2001 to directly affect firms' machinery investment from 2003 to $2008 .{ }^{9}$ Specifically, we run the following IV regression:

$$
\begin{aligned}
& \left(\Delta \frac{L_{F}}{H}\right)_{i}=\gamma_{0}+\gamma_{1} D R_{2001_{i}}+\gamma_{v} X_{i}+f\left(\Delta I_{O_{i}}, \Delta K_{O_{i}}\right)+v_{i} \text { (First stage) } \\
& \ln \left(\Delta \frac{K_{M}}{L+H}\right)_{i}=\beta_{0}+\beta_{1}\left(\overline{\Delta \frac{L_{F}}{H}}\right)_{\imath}+\beta_{v} X_{i}+f\left(\Delta I_{O_{i}}, \Delta K_{O_{i}}\right)+\varepsilon_{i} \text { (Second stage) }
\end{aligned}
$$

where $\left(\widehat{\Delta \frac{L_{F}}{H}}\right)_{l}$ is the predicted value of $\left(\Delta \frac{L_{F}}{H}\right)_{i}$ from the first stage of the regression.

[^4]Our sample of firms for the study was drawn from EDB's annual Census of Manufacturing, which surveys the larger firms (i.e., firms with 20 employees or more) every year. This allows us to create a panel of 1,500 manufacturing firms that existed in 2003 and 2008. Our findings thus apply only to the firms in our sample, which we expect to be (i) larger firms, since small firms may not be surveyed in both years; and (ii) stronger firms, since we have excluded firms that folded between 2003 and 2008.

## RESULTS

Our regression results indicate that an increase in the low-skilled FW intensity of a manufacturing firm would lead to a fall in the machinery intensity of the firm (Exhibit 1). This implies that during the period of FW policy liberalisation from 2003 to 2008, low-skilled FWs were substitutes for machinery, thereby discouraging machinery investments. Specifically, after correcting for omitted variable bias and reverse causality, we find that, on average, a 1 unit increase in the ratio of low-skilled FWs would lead to a 9.1 per cent decline in machinery intensity among the manufacturing firms (see specification 3 below). ${ }^{10}$

Exhibit 1: Regression Results for the Impact of Low-Skilled FW Intensity on Machinery Intensity ${ }^{\mathbf{1 1 , 1 2}}$

| Specification | (1) | (2) | (3) |
| :---: | :---: | :---: | :---: |
| Dependent Variable | $\Delta$ Log(Machinery Intensity) | $\Delta$ Log(Machinery Intensity) | $\Delta$ Log(Machinery Intensity) |
| $\Delta$ Ratio of low-skilled FWs | -. 005 | -. 006 | -. 091 ** |

${ }^{+}$Note: Number of observations differs in specification 3 as 153 firms were not present in the dataset in 2001, and thus could not be instrumented.

We next split our sample of manufacturing firms into revenue terciles to determine if the results differ by firm size. We find a stronger relationship (i.e., greater substitution between low-skilled FWs and machinery) for the smaller firms in our sample (Exhibit 2). In particular, for firms in the lowest revenue tercile, a 1 unit increase in the ratio of low-skilled FWs is found to lead to a 17 per cent decline in machinery intensity. One possible explanation is that smaller firms tend to utilise simpler production processes and machinery, which are more easily substituted with low-skilled labour.

[^5]Exhibit 2: Regressions Results for the Different Revenue Terciles

| Dataset | $\leq 33$ rd Revenue Percentile |  | 33rd < Revenue Percentiles $\leq 66$ th | > 66th Revenue Percentile |

## IMPLICATIONS OF FINDINGS

## Finding 1: Low-skilled FWs are substitutes for machinery in manufacturing firms

Our results suggest that low-skilled FWs were substitutes for machinery as the increase in low-skilled FW ratio from 2003 to 2008 had caused manufacturing firms in our sample to reduce their machinery intensity. This implies that continued access to cheap, low-skilled FWs could deter firms from investing in machinery (e.g. for automation). This would, in turn, have likely depressed the productivity of the firms. To help reverse this, the government has already taken steps to reduce firms' reliance on low-skilled FWs. For instance, the DRC for manufacturing was lowered from 65 per cent to 60 per cent in July 2012 and levy rates for WPHshave been raised every year since July 2010.

## Finding 2: However, the actual impact of the substitution effect on machinery intensity and hence productivity is likely to have been small

Although low-skilled FWs were substitutes for machinery, the overall impact of such substitution could be small. To estimate the actual impact of such substitution between 2003 and 2008, we apply our estimated coefficient for the low-skilled FW ratio to the actual change in the average low-skilled FW ratio among the firms in our sample. ${ }^{13}$ We find that the increase in the ratio of low-skilled FWs (at around 0.1) had led to a decline in machinery intensity of less than 1 per cent (Exhibit 3). ${ }^{14}$ Even for firms in the lowest revenue tercile, which experienced the greatest substitution between low-skilled FWs and machinery, the increase in low-skilled FW intensity had led to a marginal decline in machinery intensity of about 1.2 per cent.

Given that the machinery intensity of firms in our sample declined by a much larger 10 per cent between 2003 and 2008, our simulation results suggest that non-FW related factors could also be affecting the machinery intensity of these firms. One possibility is the increasing servitisation of manufacturing, which

[^6]could have depressed the machinery intensity of manufacturing firms as they moved into activities such as consulting, intellectual property and the administration of regional headquarters. ${ }^{15}$

Exhibit 3: Estimated Impact of Low-Skilled FW Intensity on Machinery Intensity

|  | Impact of Low-Skilled FW <br> Intensity | Change in Ratio Of Low- <br> Skilled FWs | Estimated Change in <br> Machinery Intensity |
| :---: | :---: | :---: | :---: |
| All Firms | 9.1 | 0.09 | $\mathbf{- 0 . 8 5 \%}$ |
| Firms in Lowest <br> Revenue Tercile | 17.2 | 0.07 | $\mathbf{- 1 . 2 4 \%}$ |

To the extent that there could be other factors affecting the machinery intensity of firms, our finding also suggests that apart from tightening firms' access to low-skilled FWs to boost machinery intensity and hence productivity, other measures to help firms improve their productivity (e.g., through research and development - or R\&D - and product innovation) may also be important.

## CONCLUSION

This study finds that the increase in low-skilled FW intensity of manufacturing firms during the period of FW liberalisation between 2003 and 2008 had caused them to reduce their machinery intensity. This implies that FWs were used as substitutes for machinery during this period. In particular, smaller firms were more prone to this substitution effect, having lowered their machinery intensity by twice as much as the average firm for a given increase in their ratio of low-skilled FWs.

The dampening impact of low-skilled FWs on machinery intensity is also likely to have depressed the productivity of manufacturing firms. To help reverse this, the government has already taken steps to reduce firms' reliance on low-skilled FWs. However, our findings also suggest that there are other nonFW related factors affecting the machinery intensity and hence productivity of firms. Accordingly, other measures to increase the productivity of manufacturing firms, such as helping them to focus on R\&D and product innovation, are also necessary.

2 The term "ASEAN" stands for "Association of South East Asian Nations" and refers to the ten-country Immigration \& Checkpoints Authority political association comprising Brunei, Cambodia, Indonesia, Philippines, Laos, Malaysia, Myanmar, Singapore, Thailand and Vietnam. However, when used in the statistical tables, the term excludes Singapore.
3 The STB and ICA are in the midst of transiting to a new data processing system for tracking visitor statistics. As both parties resolve some technical issues that have arisen during this period, the latest tourism data may not be immediately available.

${ }^{1}$ Operating revenue refers to receipts credited to the Consolidated Revenue Account and Development Fund Account,
Source: Accountant-General's Department
but excludes interest income, investment income and capital receipts.
${ }^{2}$ This refers to collection under Section 45 of the Income Tax Act which is a Withholding Tax on locally-sourced income earned by non-residents. The Withholding Tax collection was previously included in the figures reported under Personal Income Tax.
${ }^{3}$ Taxes on Motor Vehicles comprise additional registration fees, road tax, special tax on heavy-oil engines, passenger vehicle seating fees and non-motor vehicle licences, but exclude excise duties on motor vehicles which are classified under Customs and Excise Duties.
${ }^{4}$ With effect from March 2010, Betting Taxes include casino tax collected under Section 146 of the Casino Control Act.
${ }^{5}$ To more accurately reflect the nature of "Development Charges (DC)" as a tax under section 35 of the Planning Act, reporting of actual collection of DC has been reclassified from "Fees and Charges" to "Tax Revenue : Others" with effect from April 2009.
${ }^{6}$ Other receipts exclude repayment of loans and advances, interest income, investment income and capital receipts.

${ }^{1}$ Government development expenditure excludes land-related expenditure items and loans to statutory boards and industrial
Source: Accountant-General's Department and commercial enterprises.
Figures may not add up due to rounding
${ }^{2}$ The Ministry of Community Development, Youth and Sports (MCYS) and the Ministry of Information, Communications and the Arts (MICA) were restructured with effect from 1 Nov 2012 to form three
 Community and Youth (MCCY) was formed to undertake functions transferred from MCYS and MICA.
${ }^{3}$ Manpower expenditure under the Social Development sector refers to expenditure under the Financial Security \& Lifelong Employability for Singaporeans programme, which has been reclassified from the Economic Development sector from 2013 onwards.
${ }^{4}$ Communications and Information expenditure under the Economic Development sector refers to expenditure under the Info-Communications and Media Development programmes.

[^0]:    ${ }^{1}$ Based on preliminary estimates
    ${ }^{2}$ Figures pertain to private sector establishments each with at least 25 employees and the public sector.

[^1]:    ${ }^{1}$ The business services sector comprises diverse segments, ranging from real estate and professional services to cleaning and landscaping. The real estate and professional services segments are the two largest segments, accounting for 39 per cent and 36 per cent of the sector's nominal value-added respectively in 2012.

[^2]:    ${ }^{1}$ We would like to thank Jessica Pan, Thia Jang Ping and Yong Yik Wei for their inputs in our study. All errors belong to the authors.
    ${ }^{2}$ See for instance Terauds (2011) and Low et al (2013).

[^3]:    ${ }^{3}$ See for instance, Krueger (1993) and Goos et al (2010).
    ${ }^{4}$ If immigrants were attracted by favourable economic conditions, and we expect capital investments to be affected by these conditions as well, then we cannot tell if the relationship between immigrants and capital investment is a causal one or a correlation induced by economic conditions.
    ${ }^{5}$ We are unable to extend the period of the study beyond 2009 due to data limitations. Specifically, the educational profile of workers - which we use to define skills - is unavailable in the dataset after 2009. We also exclude 2009 from the study due to the recession caused by the Global Financial Crisis.
    ${ }^{6}$ Note that this is a first-difference model, and as such, would also control for different characteristics across firms that are time invariant.
    ${ }^{7}$ This definition is similar to Lewis' model. His model excludes workers with a degree because they are usually non-production workers (managers etc.) and hence should not be correlated with machinery investments.

[^4]:    ${ }^{8}$ See Olley and Pakes (1996). $\Delta I_{O}$ and $\Delta K_{O}$ are changes in capital investments and stock that exclude machinery. To estimate $f\left(\Delta I_{O_{i}}, \Delta K_{O_{i}}\right)$, we include a four degree polynomial function of $\Delta I_{O}$ and $\Delta K_{O}$.
    ${ }^{9}$ This condition is known as the exclusion restriction. For our IV to remove the biases successfully, firms' DRs in 2001 should not affect their machinery investment decisions from 2003-2008 through channels which are not captured in the model. In addition to selecting an IV from two years prior to our sample period, we satisfy the exclusion restriction by separately accounting for other factors that could affect machinery investment decisions. For example, we control for (i) employment structure; (ii) size; (iii) ownership structure, and (iv) firm-level efficiency through the Olley-Pakes proxy. An example of a possible factor that we cannot account for is the interest rate that individual firms face. However, we do not think this is problematic for our IV because (i) several factors that affect firm's interest rates (like size, ownership and efficiency) are captured in our model; and (ii) we do not expect banks to factor in firms' historical employment structure (DR in 2001) to evaluate their current (2003-2008) credit worthiness. To test the robustness of our IV, we also used firms' DR in 2002 and 2003 and obtained similar results.

[^5]:    ${ }^{10}$ Before correcting for reverse causality, the magnitude of our coefficient was smaller at -0.006 . Taken together, the two estimated coefficients suggest that firms that invested in more machinery hired more low-skilled FWs.
    ${ }^{11}$ We also carried out several sensitivity checks, and our results are robust to (i) the inclusion of additional labour variables (e.g., employment share of non-production workers); (ii) the exclusion of outliers (e.g., firms with no FWs); and (iii) using the ratio of low-skilled FWs to the total production workforce of a firm as our key variable of interest.
    ${ }^{12}$ While the coefficient on the ratio of low-skilled local workers was positive and significant, we should not read too much into it as the ratio was used only as a control variable. Nevertheless, one possible explanation is that the coefficient is picking up the positive correlation between movements in machinery intensity and ratio of low-skilled workers among firms in the sample over this period.

[^6]:    ${ }^{13}$ We use the coefficient for specification 3, from Exhibit 2, to estimate the impact for all firms. We multiply the coefficient with the actual increase in low-skilled FW ratio for the firms. We similarly estimate the impact for firms in the $\leq 33$ rd revenue percentile using the relevant coefficient from Exhibit 3.
    14 This is not unexpected as the manufacturing sector in Singapore is fairly advanced and capital intensive-for instance, our electronics sector has moved from assembling hard disk drives (which is something humans can easily do) to producing hard disk media. The latter requires precision that human effort alone cannot achieve. It will be difficult to replicate such manufacturing with labour.

[^7]:    ${ }^{15}$ For instance, Professor Andy Neely found that more than 40 per cent of manufacturing companies in Singapore have servitised as of 2007. This is the third highest level when compared to other manufacturing intensive economies like Germany, Switzerland and Taiwan (accessed through
    http://opim.wharton.upenn.edu/fdecon/presentations/DAY\% 201\% 20AM/PANEL\% 201/Neely\% 20110228-WhartonForum.pdf)

[^8]:    ${ }^{16}$ We use SPRING's definition of SMEs: firms' annual sales turnover of not more than $\$ 100$ million or employment size not more than 200 workers.

[^9]:    ${ }^{1}$ For inventories, this refers instead to change as a percentage of GDP in the previous year.

[^10]:    ${ }^{1}$ Derived by relating expenditure on the item to the total monthly household expenditure.

[^11]:    Note: Data are based on Standard International Trade Classification (SITC) Rev 4.1

[^12]:    Note: The industries are classified according to SSIC 2010.

[^13]:    ${ }^{1}$ The weights are used in the computation of the indices from 2010 onwards.
